WORK EXPERIENCE

Server Repair Technician I **June 2026 – Present**
SMS InfoComm Grapevine, Texas

- Flash-test 90+ NVIDIA H100/H200/B200 data center GPUs per day on CentOS Linux test servers, troubleshooting hardware and firmware problems through step-by-step diagnostic workflows.
- Respond to engineer requests to test and validate hardware through the company's in-house ticketing system, and open tickets for server faults and unexplained errors, using the same system for documentation.
- Escalate unresolved failures to engineers after retesting on alternate boards and test servers.
- Cross-trained on every station in the GPU repair workflow, including heatsink replacement, labeling, and cluster testing, and help other stations when needed.

PROJECTS

Active Directory + Entra ID Lab | GitHub

- Built a four-system virtual lab with a domain controller, gateway server, file server, and domain-joined Windows 11 client, using Active Directory with department OUs and security groups for Engineering, Marketing, HR, and IT.
- Created domain user accounts and assigned them to departmental security groups, then practiced moving accounts between OUs, resetting passwords, and deleting accounts.
- Synced five Active Directory user accounts and four departmental security groups to Microsoft Entra ID with Entra Connect Sync and password hash sync, so one password works for local and cloud sign-in.
- Resolved a simulated MFA lockout by requiring Microsoft Authenticator re-registration through Entra ID.
- Isolated a connectivity failure using ping and ipconfig, then restored communication by correcting a Windows Firewall rule that was blocking ping.

Raspberry Pi Network Monitoring Server | GitHub

- Added 8 monitors covering internet access, DNS, the domain controller, the file server, and the directory and file sharing services, using ping for host availability and TCP checks for specific services.
- Tested outage detection by shutting down the file server on purpose and confirming the dashboard flagged it down in about 40 seconds, then up after restart.

Cisco Campus LAN Lab | GitHub

- Designed and configured a campus network in Packet Tracer with one core switch, two access switches, and two routers, split into four VLANs with trunks and inter-VLAN routing.
- Set up LACP EtherChannels and Rapid PVST+ with the core as root bridge, and protected access ports with PortFast and BPDU Guard, then tested BPDU Guard by plugging a switch into an access port and confirming the port shut down.
- Fixed EtherChannel ports that were suspended by recreating the channel group, then confirmed end-to-end connectivity with a ping from a LAN PC to an outside test address.

CERTIFICATIONS

CompTIA Network+, Google IT Support Professional Certificate, CCNA (expected Jan 2027)

EDUCATION

B.S. in Computer Information Systems and Technology **Expected Graduation, May 2028**
University of Texas at Dallas Richardson, Texas
Relevant Coursework: IT Essentials, Intro to Networking

TECHNICAL SKILLS

IT Support | End-User Support, Troubleshooting, Ticketing Systems, User Account Administration, Documentation, Excel
Systems | Windows 11, Windows Server, Microsoft 365 (Outlook, Teams, Word), Microsoft Entra ID, Active Directory, Group Policy, Linux
Networking | TCP/IP, DNS, DHCP, NAT, Subnetting, VLANs, Ping, Traceroute
